DGRC Vector Standard Operating Procedure 2.0: Preparation of clones for Whatman® FTA® MicroCards for Distribution by the DGRC (CloneIDs #2000-13999)

Kris Klueg

Drosophila Genomics Resource Center, Center for Genomics and Bioinformatics, Indiana University, Bloomington, Indiana, 47405

To prepare the MicroCards:

1. A 0.5 mL culture of each clone is started by stabbing through the foil seal and touching the frozen culture.
2. Inoculated cultures are grown overnight at 37°C and then transferred to larger flasks containing 25 mL of media.
3. After overnight growth at 37°C, the culture is spun down, the bacterial pellet raised in 450 µL of 1X TE and immediately spotted on Whatman® FTA® MicroCards.

Cards are air-dried overnight and are kept in desiccated storage at room temperature for future requests.

Requests for a given clone are processed as follows:

1. The FTA card of the clone is pulled and a 2 mm punch is taken from it.
2. The punch (disc) is immediately transferred to a sterile microfuge tube and shipped within 24 hours.
